How to Create a Website without Any Programming Knowledge?

Chapter TWO:

What Types of Website Work Best?

Chapter THREE:

How to Make a Website for Free?

Chapter FOUR:

How to Build Professional Website at Lowest Cost Possible

CONCLUSIONS & Recommended RESOURCES

“How to Create a Website without Any Programming Knowledge?”

Many of those who like to build websites have asked this question thousands and hundreds of times, especially those who do not know any programming languages like HTML, PHP, JavaScripts or MySQL.

Do not worry about that. This is why this eBook is here to help you.

In today's technology, especially with the availability of open sources, there's not necessary to know all about these kind of programming languages in order to build and create your own website.

You can build a website easily... I really mean it's very easy which only takes you 1 minute to build a super nice professional website. You hear me right! Only ONE minute!

What Types of Website Work Best?

Firstly you need to decide what type of website you want to build. There are several types of website you can build, but they are mainly consisting of 2 types:

- **Blog**
 - Blog is a website that people that are mainly use to write their daily work, and about themselves.
 - Blog is quite popular today due to its simplicity
 - However if you are serious about website, this should not be your choice as it doesn't look like conventional website
- **Website**
 - Website is what you normally see on the internet as this is the type of website that most people will build or create.
 - This include normal website (content) , membership websites, forum, photo gallery, calendar, whether...
 - Easy and fine navigation bar

Many are confused if they want to build a website or a blog before starting a website.

My suggestion is to go for the better choice, building a website, and not a blog. Furthermore, with today's open source support, you can build-in a blog into your website anytime as you want. Any not start building a website?

How to Make a Website for Free?

Making website for free is possible today with the competitive of internet service providers. There are many companies on the web providing this kind of free websites services to everybody who want to have their own websites but want to it to be free.

The reason of being offered a free service is that these companies will place advertisement on your website or such.

There are several companies that provide free website services, for example:

- <http://www.blogspot.com>
- <http://www.freewebs.com>
- <http://www.weebly.com>
- <http://geocities.yahoo.com>
- <http://ww.tripod.lycos.com>

and much more...

I used to have few websites that used these services before but I was not happy for my website based on several reasons as stated below and went on build my own websites.

If you really need to own website that look professional, try avoiding my pitfall and bad experiences. I abandon the free services based on several reasons:

1. You cannot have <http://www.YourName.com> that you prefer. Most likely it will look like <http://YourName.ServiceProviderName.com> or [http://www.ServiceProviderName.com/YourName /](http://www.ServiceProviderName.com/YourName/)
The name looked ugly and not professional, not good impression.
2. No much control. For example, you want to share a file. You are not able to do that.
3. Images. Most of the time, you cannot upload the image to the web server. Even some services allow you to upload images; your images might be resized (limited size).

4. If your website has gained popularity, you would like to earn money from advertisements. You can't place ads around your website as you like.
5. Even worst, if the company place an ads around the corner of your website or such. Your website will look ugly.
6. Not much design. There are only few templates / design available

Ok, now let's move on and I would like to guide you on more professionally own website.

It's easy, and you can get it done within one minute.

How to Build a Professional Website at Lowest Cost Possible?

Step 1: Get a Domain Name

Now you want to get a domain name for your website, it may be .com .net .org or .info. I would suggest that you get a .com as it's the most popular, however .net .org .info .biz and .us also have no big different. It's just the name anyway.

A domain name is looked like this:

<http://www.YourName.com>

It look more professional and it's easier for people to remember you instead of remembering the long ugly name as you can get from free services.

You can register domain name with domain name registrar, a company that to help you register your website name. There're many companies out there doing this but there is few which are selling at very low cost.

I use [GoDaddy](#). It provides one of the great services with excellent control panel on the web at very low cost. Sometimes, when there's a promotion as you register a new domain name, you can get it at \$9.99 per year. On top of that you can register with a discount code which gives you approximately additional 10% discount:

These are the discount codes that I use:

1. **cjcsave10** - Save 10% on any order
2. **cjc695dom** - \$6.95 .com domain names

Once you have registered a domain name with [GoDaddy](#). Now you need to have space to host your files and data. You can do it with your PC that configured as a server, but you don't want your PC to run 24 x 7, do you?

Thus you need to get a hosting service.

The problem is there are so much webhosting out there, how can you determine which one is good for you. I've bad experiences with 3 webhosting companies before I came to these good hosting companies.

Step 2: Getting a Good Webhosting Service

Webhosting is a service that gives you a space to host your website and files. There are many webhosting services out there if you want to find online, however the best that I could find is [HostGator](#) and [Exabytes](#).

[HostGator](#) - \$4.95 per month (recommended – low cost with no contract commitment)

[Exabytes](#) - \$3.65 per month (2 years subscription)
or \$4.65 per month (1 year subscription)
or \$ 7.65 monthly

By the way, these are the [HostGator](#) discount codes, you can get one month hosting for free (discounted)

1. iceishot
2. findmyhost
3. hostgator
4. tophost
5. 404PAGE
6. findmyhost

They provide great support; the staffs can greatly help you within 12 hours. So far, I receive great services and support when there was once their local time was 2am to 5am midnight, I received response within 15minutes from both of them.

Step 3: Setting Your DNS with GoDaddy

Once you have a domain name (from [GoDaddy](#) or other registrar) and web hosting (from [HostGator](#) or [Exabytes](#) or other services), you need to login to [GoDaddy](#), go to the control panel to set your domain name DNS to your webserver DNS.

You can find your web server DNS (HostGator or Exabytes) from the email that they sent to you.

Step 4: Select the Best Website Open Source Scripts

A website couldn't work without any code; this is how I get my website up in just one minute. There are plenty of open source scripts (free) on the internet that are developed by a group of people sharing their interest in the field, including building website.

This group of people continuously updates and improves the scripts, and making the scripts better and better over time. You can get great support from them.

However, if you never know, there are too many open source scripts that make you hard to choose even it's free. If you participate in any online forum about building website, they will recommend different types of open source scripts by comparing each of them.

I started building website in year 2004. As a conservative person, I installed different scripts on different websites of mine, and eventually end up with only one that I use now, Joomla.

Why Joomla?

Joomla is an open source scripts that enables you to build your website easily, which means it's free.

As a powerful content management system (CMS), everything within Joomla is WYSIWYG. You just have to write your content and publish it. It will do everything for you in just seconds.

It has won several major awards. The advantages of Joomla:

- ✓ You may find Wide range of supports from open source programmers; they are there to help us.

- ✓ Plenty of plug-in that can be installed to your Joomla to make it work the best for you, for example:
 - Forum
 - Calender
 - Newsletter
 - Voting and Pool
 - Advertisement Banner (if you want to earn money)
 - News
 - Annoucement
 - Whether
 - Image gallery

- Shout Box (Chat Box)
 - Blog
 - And many more....
- ✓ Availability of Joomla templates, thousands of free Joomla templates out there for download. You can select your site design differently. You can easily change them from time to time without affecting your content of your website

Step 5: Install Your Website with Joomla

Installation of Joomla may take some times if you do not know how to do it. However, there are 2 easy solutions you may seek for:

- ✓ Outsource for professional to install it for you, normally they will charge \$19 per one website installation.
- ✓ Or learning the BONUS #3 video tutorial that guiding you step by step in installing Joomla in just one minute, from [Joomla Template Secrets](#).

Step 6: Select Your Website Design

There are plenty of free designs circulating on the internet and you may download and use it for your website.

After you have installed your website with Joomla, you need a nice design for your Joomla website. There are many free Joomla templates in the internet that you can search for free; many have successfully got their website design for free. You can do that too.

However, I've taken 2 years of experiences for searching nice and professional free Joomla templates on how and where to find more than 3500 free Joomla templates. Eventually come up with Joomla Template Secrets. From this book, there are directories that you can find plenty of templates and new templates from time to time. This book also include how to mimic Google, Yahoo, eBay and super giant website technique that you can even apply on your Joomla website. You can do that easily without any cost.

Another alternative, you may want to get a commercial template which is quite expensive, normally \$29++ per template. There are many criteria that

you need to meet to purchase a commercial Joomla template, learn before you wasted your money. I would suggest that you learn from free Joomla templates first before get your hand on commercial Joomla template to avoid wasting your money. Or you can refer to the BONUS #1 report: Professional Template Myths from [Joomla Template Secrets](#), based on my previous painful experiences with commercial Joomla templates.

"Who Else Want to Discover Websites to Unlimitedly Download FREE Joomla Templates And the Secrets of Joomla Templates That Joomla Pro Never Share with You?"

"You Shouldn't Have Missed This Again!"
[Click Here to Start Building Nice Website Immediately in Just One Minute!](#)

Step 8: Writing Your Content

Once your design or your template is installed, you should have started posting your articles.

Just login to the backend and start posting your contents and writing your articles, your website is ready.

Conclusion and Recommended Resources:

You can create a free website with no cost or a professional website with only a little cost that consist of:

Your domain:

\$6.95 per year ([GoDaddy](#) with discount code)

Your webhosting:

\$4.65 per month ([HostGator](#)) - recommended

Joomla software:

Free (or install easily using BONUS#3 of [Joomla Template Secrets](#))

Joomla template:

Free (or 3500+ free Joomla templates by [Joomla Template Secrets](#))

Building a website is great, and I hope you will have your website up very soon.

Best Regards,

James Tan
